

Python Programming Essentials

Section 1: Lambda Functions

A lambda function in Python is a small anonymous function defined with the lambda keyword. It can take any number of arguments, but can only have one expression. Syntactically, python lambda functions are used when an anonymous function is required for a short period of time.

Python Programming Essentials

Section 2: Python Decorators

Decorators in Python allow you to modify or extend the behavior of a function without modifying the function code itself. They wrap another function.
